
ML-KEM.Decaps(dk, c)

Uses the decapsulation key to produce a shared secret key from a ciphertext.

Checked input: decapsulation key $dk \in \mathbb{B}^{768k+96}$.

Checked input: ciphertext $c \in \mathbb{B}^{32(d_u k + d_v)}$.

Output: shared secret key $K \in \mathbb{B}^{32}$.

1: $K' \leftarrow \text{ML-KEM.Decaps_internal}(dk, c)$

▷ run internal decapsulation algorithm

2: **return** K'
