

ML-DSA Digital Signature Process

✓ Signature Verified Successfully!

Bob has confirmed that the message was genuinely signed by Alice and hasn't been tampered with. The signature provides authenticity (Alice really signed it) and integrity (the message hasn't changed).

(During an actual digital signature process, only the public key, message, and signature are transmitted. The private key remains confidential to the signer (Alice). Anyone with Alice's public key can verify her signatures, but only Alice can create them.)
